For information on the specific selection and validation of MSVA antibodies,  
see pages 2-12.

Our product overview can be found on pages 14-29, the individual  
antibodies are listed on the following pages.

# „Many IHC publications complicate the work of pathologists and researchers due to non-specific antibodies“

Literature data on immunohistochemical detection of proteins are often confusing. Data on the expression of relevant proteins in individual tumor types often vary between 0 and 100%. A reason for this is the use of insufficiently validated antibodies with non-specific staining behavior.

The PLAP example makes this clear<sup>1</sup>. The colored dots reflect the results of previous studies. In the case of yolk sac tumor, adenocarcinoma of the pancreas, leiomyoma and leiomyosarcoma, the data are between 0 and 100%. But the results are also very divergent for other tumors. The X shows the result of the study by Reiswich et al. with the MSVA antibody MSVA-350R and the protocol we proposed. This performance can be expected with the antibody MSVA-350R.

MSVA has set itself the task of only offering antibodies that have been fully validated on formalin-fixed tissues.

All information on the staining behavior of our antibodies on more than 50 different normal tissues can be found here on our homepage.

<sup>1</sup> Graphic based on Reiswich et al. (2021): "Pattern of placental alkaline phosphatase (PLAP) expression in human tumors: a tissue microarray study on 12,381 tumors." published in The Journal of Pathology August 7<sup>th</sup> 2021

# Why is antibody validation different from antibodies in immunohistochemistry?

Formalin fixation exerts a profound influence on the three-dimensional structure of proteins and the accessibility of epitopes. Because formalin fixation is such a powerful manipulation of proteins, traditional methods for evaluating antibodies on unfixed "perfect" proteins such as Western Blot, ELISA, protein microarrays are of little use, even on very well-selected experimental control materials such as "KO" cell lines ". This way good and bad antibodies cannot be distinguished from one another.

Antibodies intended for use on formalin-fixed tissue must therefore be specifically validated on formalin-fixed tissue. According to the **International Working Group for Antibody Validation (IWGAV)**, there are only two ways to document the specificity of antibodies for immunohistochemistry on this type of tissue. These are:

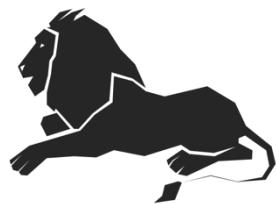

## 1. orthogonal strategy

This means the comparison with a second independent method for measuring expression across a large number of different tissue types.

## 2. independent antibody strategy

This means a comparison with one or more independent antibodies for the same target protein. Specific staining is achieved with both antibodies, while staining found with just one antibody must be considered non-specific or cross-reactive.

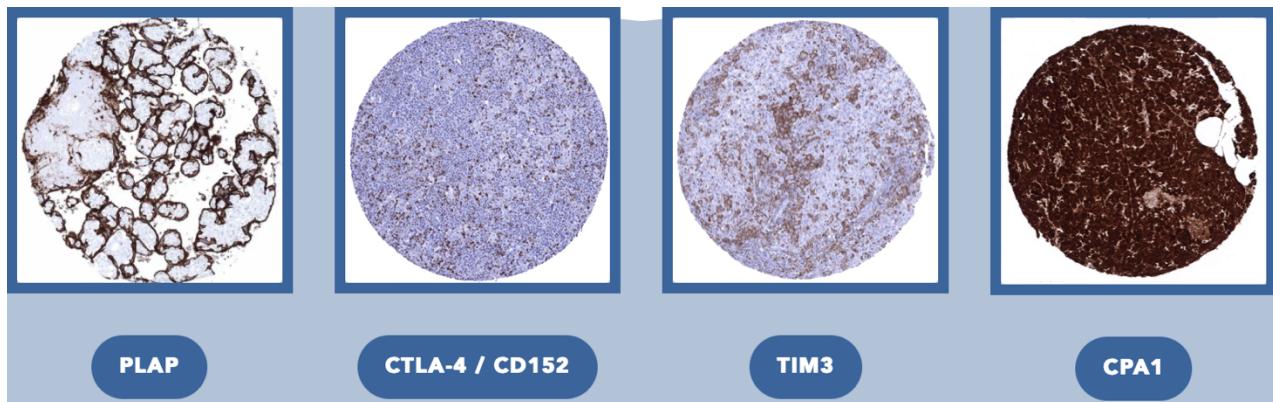

To ensure the best possible validation and to avoid the problem of non-specific antibodies, MS Validated Antibodies combines both approaches. The resulting abundance of information on the antibodies is available on our website.

MS

# Validated Antibodies

1. Large-scale tissue-validated antibodies specifically designed for immunohistochemistry on formalin-fixed tissue
2. Unique antibody documentation on the MSVA website with 60-100 images of relevant normal tissues and selected tumors
3. Documented performance characteristics of many antibodies in studies involving more than 10,000 tumors

**MS Validated Antibodies** is dedicated to providing optimal monoclonal antibodies for immunohistochemistry and providing users with unique product documentation that allows them to better understand their antibodies. Key features of the MSVA package include:

- Strict product selection criteria: **Only 130** of the first 3800 antibodies evaluated were selected for the MSVA portfolio.
- **Protocol suggestions** for manual staining and autostainers (Dako, Leica, Ventana).
- Published **data on the performance characteristics** of our antibodies are compiled on the MSVA website (if available).

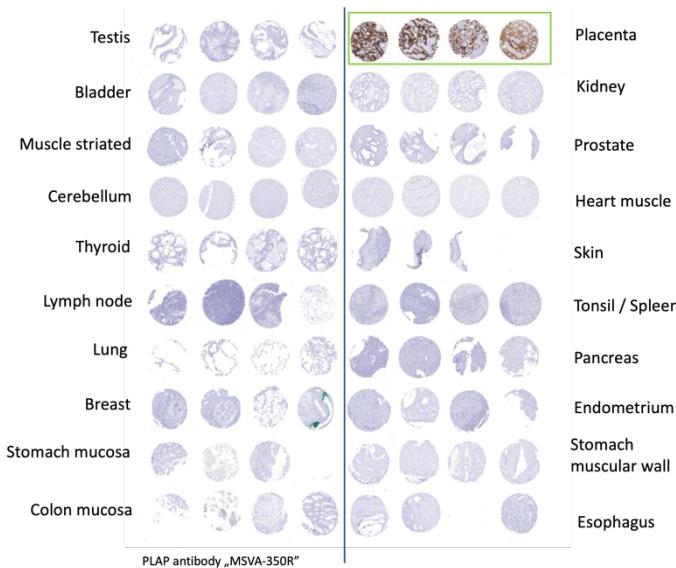

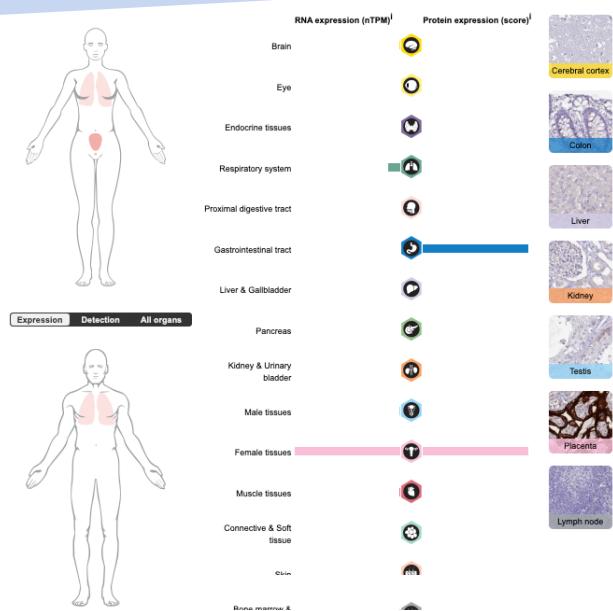

# Hands-on Approach

1

## Look up

RNA data from the Human Protein Atlas (HPA) show in which tissues staining is to be expected.

For example, a PLAP antibody is expected to stain almost exclusively in the female genital tract (placenta).

2

## Stain

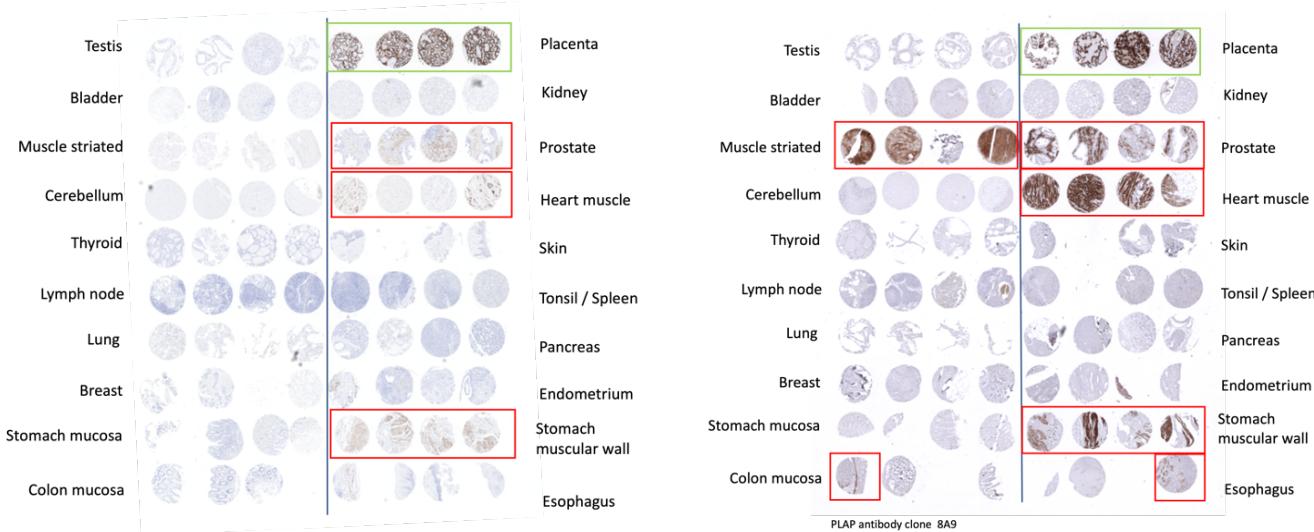

Our PLAP clone MSVA-350R only stains placenta on a TMA test.

This result was expected based on the HPA RNA data (orthogonal strategy).

3

## Compare

The comparison with another MSVA product candidate and another independent and established clone on the market confirms the placenta staining as specific. Additional staining of the two antibodies are both "antibody-specific" and represent cross-reactions.

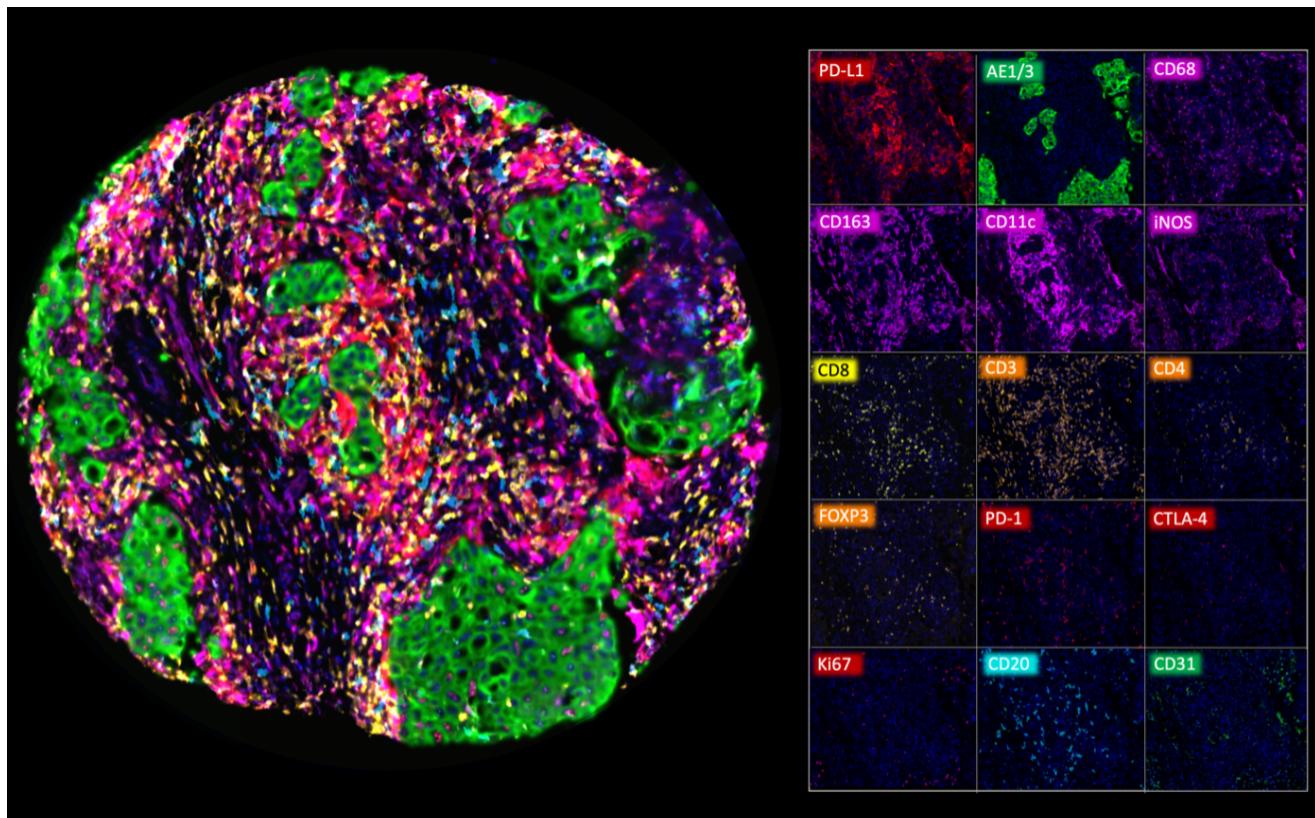

# The future of Immunohistochemistry

**Multiplex fluorescence immunohistochemistry (mFIHC)** is the future of immunohistochemistry. It allows multiple antibodies to be applied to a tissue slide. Currently available devices allow the simultaneous analysis of **4** (Versa 8, Leica), **6** (Vectra Polaris, AKOYA) up to **more than 50** antibodies (CODEX, AKOYA). Sophisticated analysis frameworks use artificial intelligence to identify specific cell types defined by a combination of positive and negative antibody staining and the spatial relationship between those cell types.

Due to the high number of different "colors" on each stained slide and the impaired differentiation of morphological cell types in fluorescence imaging, visual quality control of individual antibodies becomes impossible. Non-specific or cross-reactive antibody staining of one or more antibodies used in a multicolor panel can seriously distort the data and conclusions from the experiments.

Hence the quality of the composite in a mFIHC panel  
antibodies crucial.

Here an mFIHC panel with 15 antibodies used at the same time. Image provided by Dr. Niclas C Blessin.

# MSVA website - a useful guide for our antibody users.

We provide our own data as well as links to other relevant sources such as the Human Protein Atlas, the TCGA database or published studies. Most of the information is underlined with images, graphics, and tables.

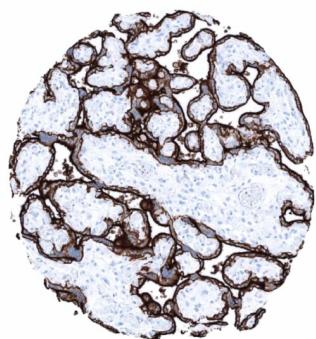

## Protocol Recommendations

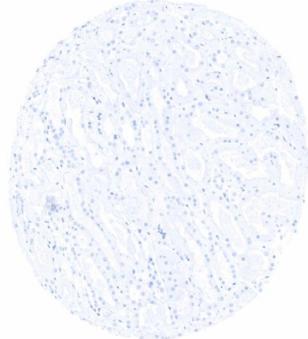

We offer protocol recommendations for manual protocols and autostainers from Dako, Leica and Ventana.

### Agilent / Dako – Autostainer Link 48

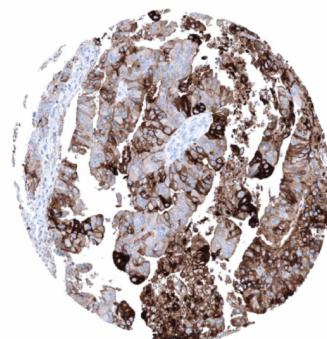

Pretreatment in PT-Link for 30 minutes at 95°C (pH high); FLEX peroxidase blocking for 5 minutes (room temperature), MSVA-350R 1:150 for 20 minutes (room temperature), FLEX+ mouse/rabbit (LINKER) for 15 minutes (room temperature), horseradish peroxidase (HRP) for 20 minutes (room temperature), FLEX DAB+Sub-Chromo for 10 minutes (room temperature), FLEX hematoxylin for 5 minutes (room temperature).

Dako – Placenta

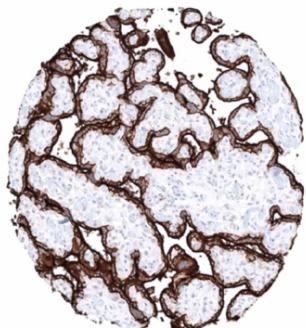

Dako – Kidney

Dako – Esophagus Adenocarcinoma

### Leica – BOND RX

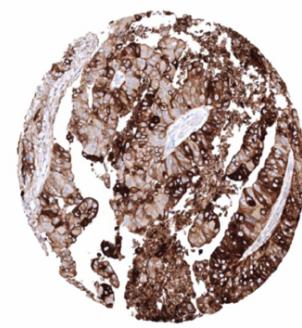

Dewax at 72°C for 30 seconds; Pretreatment in Bond Epitope Retrieval Solution (ER2 – EDTA pH9) for 20 minutes at 100°C; Peroxidase blocking for 5 minutes (room temperature), MSVA-350R 1:150 for 15 minutes (room temperature), Post primary (rabbit anti mouse) for 8 minutes (room temperature), Polymer (goat anti rabbit) for 8 minutes (room temperature), mixed DAB refine for 10 minutes (room temperature), hematoxylin for 5 minutes (room temperature).

Leica – Placenta

Leica – Kidney

Leica – Esophagus Adenocarcinoma

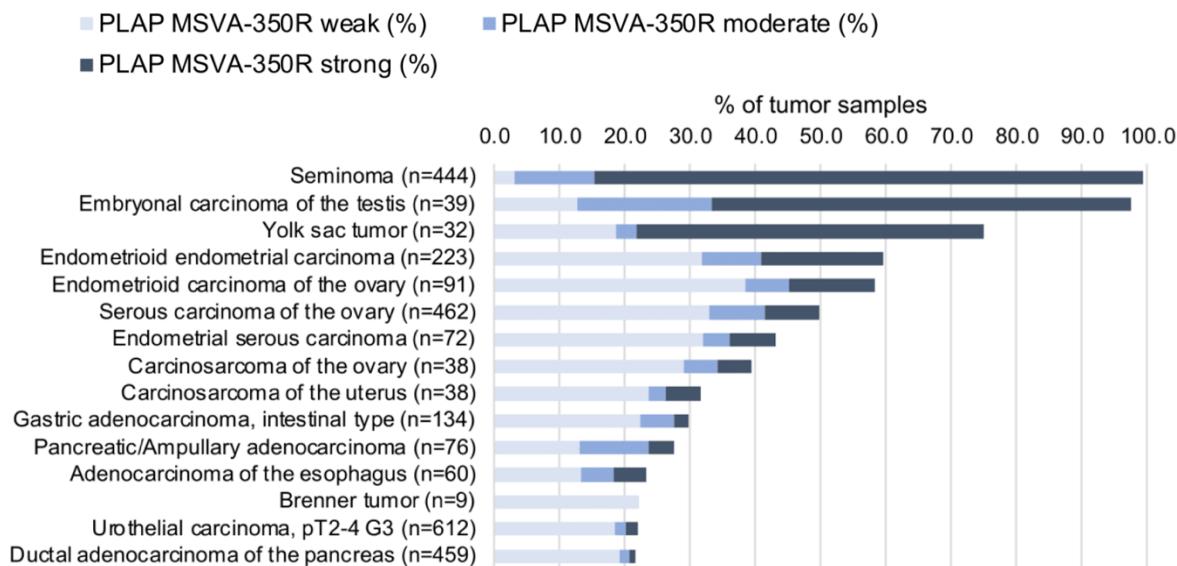

## Compatibility of Antibodies

We summarize data from studies that used the MSVA antibodies and our recommended protocols.

Data from the publication: "[Pattern of placental alkaline phosphatase \(PLAP\) expression in human tumors: a tissue microarray study on 12,381 tumors](#)". Published by Reiswich et al. in the journal of Pathology: Clinical Research, August 7th 2021.  
Summarized in own graphics:

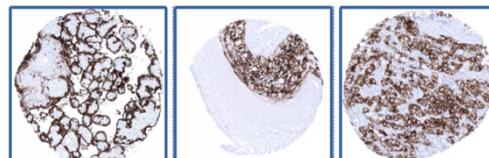

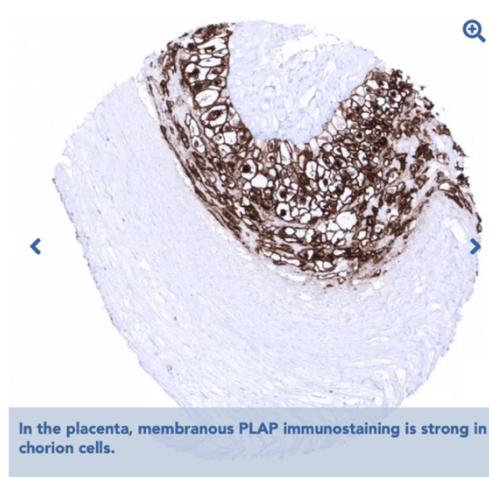

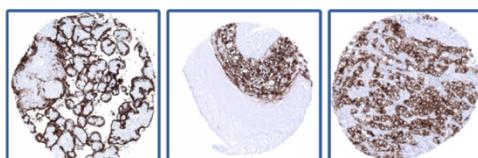

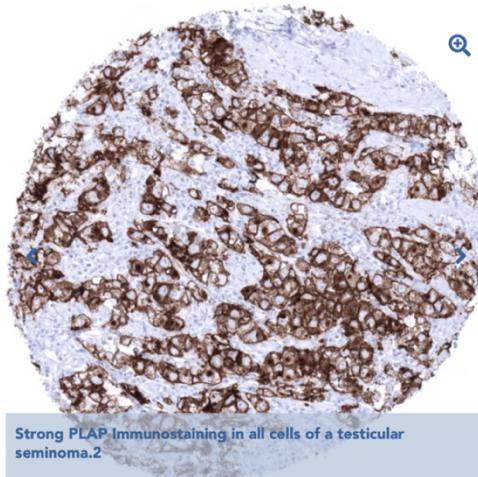

### 2. PLAP staining in tumors "ranking order" by positivity with antibody MSVA-350R.

## Product details

Comprehensive and visualized information on staining patterns in tumors.

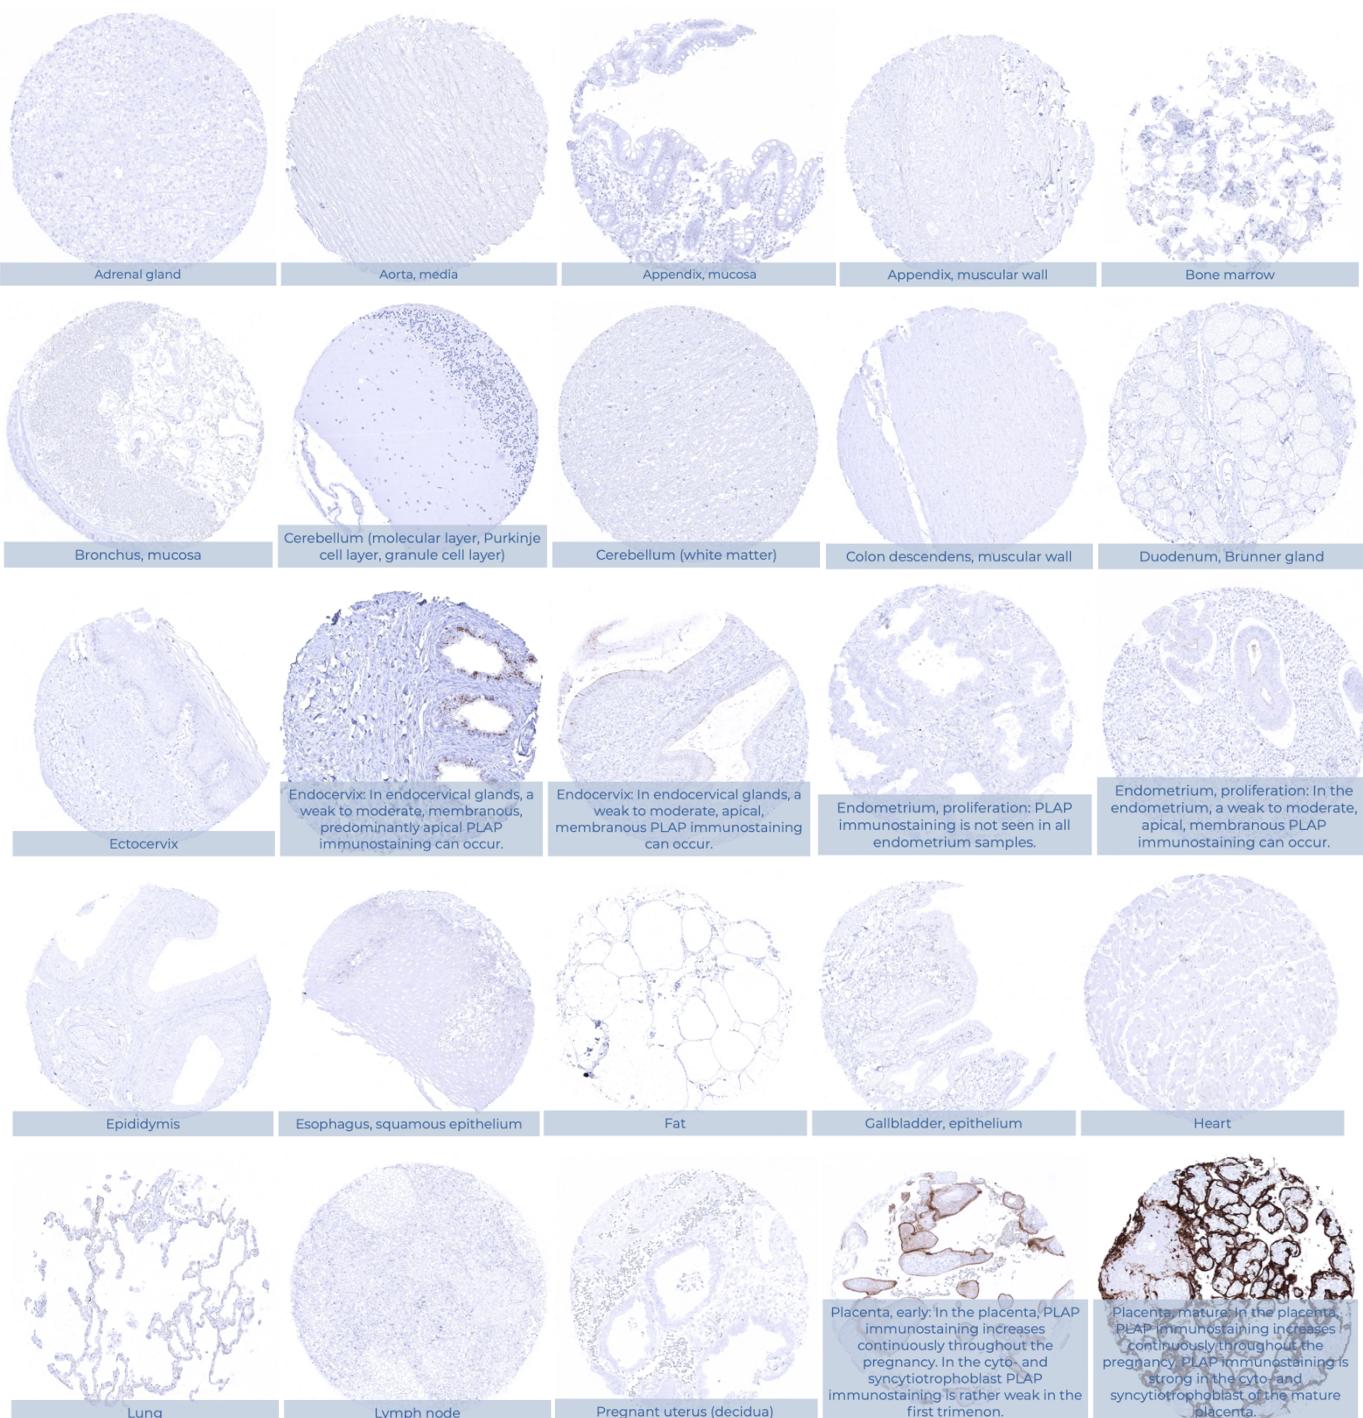

## Normal tissue gallery

## Cancer tissue gallery

A gallery for normal and tumor tissues is supplied with each antibody. The gallery contains more than 50 normal tissues. The images serve as a reference as to what staining can be expected with the proposed protocol using the MSVA antibodies in individual tissue types.

An example of a gallery of normal tissue (>50 tissues) on our website.

An extract of the PLAP (MSVA-350R) normal tissue gallery.

## Staining Pattern in Normal Tissue

The data on the staining behavior in normal tissue is also represented in a table.

### PLAP – Staining pattern in normal tissues (MSVA-350R)

Brain	Cerebrum	Negative.

#### Abstract

Placental alkaline phosphatase (PLAP) is commonly expressed at high levels in testicular germ cell tumors. PLAP immunohistochemistry (IHC) is thus often used to confirm this diagnosis, especially in cases of putative metastasis. However, other tumors can also express PLAP. To comprehensively determine PLAP expression in normal and tumor tissue, a tissue microarray containing 16,168 samples from 131 different tumor types and subtypes as well as 608 samples from 76 different normal tissue types was analyzed by IHC. Moderate to strong PLAP positivity was found in 27 (21%) of 131 different tumor types including seminoma (96%), embryonal carcinoma (85%), and yolk sac tumors of the testis (56%); endometrioid carcinoma of the endometrium (28%) and the ovary (20%); gastric adenocarcinoma (22%); serous carcinoma (not otherwise specified) of the ovary (17%) and the uterus (11%); adenocarcinoma of the ampulla of Vater (15%); carcinosarcoma of the ovary (11%) and the uterus (8%); esophageal adenocarcinoma (10%); invasive urothelial carcinoma (4%); cholangiocarcinoma (2%); and adenocarcinoma of the lung (1%). Low-level PLAP immunostaining, often involving only a small fraction of tumor cells, was seen in 21 additional tumor entities. The clinical significance of PLAP expression may vary between tumor types as high PLAP expression was linked to advanced pathological tumor stage ( $p = 0.008$ ), nodal metastasis ( $p = 0.008$ ), and lymphatic ( $p = 0.0007$ ) and blood vessel invasion ( $p = 0.0222$ ) in colorectal cancer, but to low pathological tumor stage in endometrial cancer ( $p = 0.0043$ ). In conclusion, our data identify several tumor entities that can show PLAP expression at comparable levels to testicular germ cell tumors. These tumor entities need to be considered in cases of PLAP-positive metastasis. Low-level PLAP expression can be found in various other tumor entities and should generally not be viewed as a strong argument for germ cell neoplasia.

#### Abstract

Carboxypeptidase A1 (CPA1) is a zinc metalloprotease that is produced in pancreatic acinar cells and plays a role in cleaving C-terminal branched-chain and aromatic amino acids from dietary proteins. This study assessed the utility of immunohistochemical CPA1 staining for diagnosing pancreatic acinar cell carcinoma (ACC). A total of 12,274 tumor samples from 132 different tumor types and subtypes as well as 8 samples each of 76 different normal tissue types were interpretable by immunohistochemistry in a tissue microarray format. CPA1 was strongly expressed in acinar cells of all normal pancreas samples but not in any other normal tissues. CPA1 immunostaining was detected in 100% of 11 pancreatic ACCs and 1 mixed acinar endocrine carcinoma, but absent in 449 pancreatic ductal adenocarcinomas, 75 adenocarcinomas of the ampulla Vateri, and 11,739 other evaluable cancers from 128 different tumor entities. A weak to moderate diffuse staining of epithelial and stromal cells of cancer tissues immediately adjacent to non-neoplastic pancreatic acinar cells often occurred and was considered to be caused by the diffusion of the highly abundant CPA1 from normal acinar cells that may have suffered some autolytic cell damage. In conclusion, our data show that CPA1 is a highly sensitive and largely specific marker for normal and neoplastic pancreatic acinar cells. CPA1 immunohistochemistry greatly facilitates the otherwise often difficult diagnosis of pancreatic ACC.
